

Human Development Index (HDI) Predictor

Empathy Map

Project: Human Development Index (HDI) Predictor

Phase: Brainstorming & Ideation

Developer: Nainaru Thulasi Ram

1. Persona

Primary persona: a policy researcher or graduate student comparing development levels across countries.

2. Says

- "I want to see how a country compares without opening the full UNDP report."
- "I want to test a country's data even if some indicators are estimates."

3. Thinks

- Wonders whether small indicator changes would shift a country's tier
- Assumes the HDI formula is complex and not worth recomputing by hand

4. Does

- Cross-references multiple reports/spreadsheets to find country indicators
- Manually approximates a country's likely development tier from memory

5. Feels

- Frustrated by scattered, hard-to-compare indicator data
- Reassured when a tool gives an instant, explainable score

6. Pain Points

- No single, fast interface to enter indicators and get an HDI estimate
- Uncertainty about how each indicator individually affects the final score

7. Gains

- Immediate HDI score and development category for any indicator combination
- A simple web form — no spreadsheet formulas or manual lookups required
